

Kinzoku Website Rebuild Plan

Oct 1, 2026 · @kAlzen

kinzokutrade.com will be rebuilt as a single Next.js application with a built-in database and a live-update (WebSocket) channel. Every page keeps its current content and web address, and the Privacy Policy stays word for word. The work runs in five phases over about 10 weeks for one developer (estimate).

What stays and what changes

The rebuild changes how the site is made and how it looks. It does not change what the site says, where its pages live, or the Privacy Policy.

Stays exactly the same

- All text, specifications, tables, blog articles, job descriptions and language pages, copied from the current site. Only clear spelling and grammar mistakes are corrected.
- Every web address (for example `/coil-nails-staples-bulk-nails-epal-certified-pallet-nails`). Google rankings and shared links keep working.
- The Privacy Policy, word for word, at `/privacy-policy` .
- Company details: name, KvK 42042968, VAT NL005451507B80, email, phone, LinkedIn, WhatsApp.

Changes

- One formal design across every page, including the language pages.
- Content moves out of embedded frames into the page itself, so Google can read it.
- The Google Form is replaced by Kinzoku's own quote form, stored in Kinzoku's own database.
- The cookie banner actually blocks tracking until the visitor accepts.

Keeping the Privacy Policy true without editing it

The policy makes promises the new site must keep. The plan is shaped around them so no wording has to change.

The policy says	What the new site does
The website is hosted by Hostinger in EU data centres (France, Lithuania or the Netherlands)	Run the new site on a Hostinger VPS in an EU data centre; the database lives on the same server
Analytics platforms such as Google Analytics	Keep Google Analytics 4, loaded only after cookie consent
Cookie preferences via a cookie link in the footer	Add a "Cookie settings" link to the footer (missing today)
RFQ and contact data deleted within 1 year if no business relationship	A nightly database job deletes RFQs older than 12 months that are not linked to a client
Client and transaction records kept up to 7 years	Client-linked RFQs and orders are kept, then deleted after 7 years
HTTPS for all traffic	HTTPS for every page and secure WebSockets (WSS) for live updates
Contact form collects name, email, phone, company	The new quote form collects the same, plus product details

Any new outside service (for example error tracking or a chat widget from another company) would need a new line in the policy. The plan avoids them by default; they appear only as optional features at the end.

Page-by-page redesign

Every current page is rebuilt with its existing content in a clearer order, and every page ends with a quote request. Two pages are new: a real About page and a blog index.

Page	Address	New layout, top to bottom	Content taken from
Home	/	Headline (one H1) with "Request a quote" and "View products" buttons → four trust badges in one row → product cards with photos → the 4-step "wire rod to nails" process as a clean stepper → why Kinzoku (EN 10204 3.1, CBAM declarant, CIF/DAP/DDP in EUR) → mission, vision, values → quote banner	Current homepage
About Us (new)	/about-us	Company story → mission, vision, values → how we work in 6 steps → regions served → company details (KvK, VAT) → quote banner	Homepage "About Us" + How We Work article
Nail Wire and Wire Rod	/low-carbon-steel-wire-rod-and-drawn-nail-wires	Title and summary with photo → sizes and chemistry table → grades and standards → machine compatibility (Enkotec, Wafios, Vitari) → applications (nail-wire related only) → customer references → quote form for wire	Current page; off-topic filler removed
Coil Nails, Staples, Bulk Nails, EPAL Nails	/coil-nails-staples-bulk-nails-epal-certified-pallet-nails	Title → tabs for Coil Nails, Staples, Bulk Nails, EPAL Nails → each tab: photo, specs, readable size table → tool compatibility → FAQ as open/close questions → one quote button	Current page, including the embedded size table and FAQ

Page	Address	New layout, top to bottom	Content taken from
Long Products	/long-products-alloy-bars-carbon-bars-bright-bars	Short intro explaining the bar-steel line → grades table that fits the screen → quote form for bars	Current embedded table
CBAM	/cbam-europe	Headline → the three problems → Kinzoku's solution (DDP, advisory) → CBAM cost calculator → "Send me this estimate" → related CBAM articles	Current page and calculator
Contact	/contact-us	Contact details and map → Kinzoku's own quote form → office hours and reply time	Current page; Google Form replaced
Old quote link	/contactus-sales	Permanent redirect to /contact-us#quote (fixes the broken buttons on the language pages)	—
Job Openings	/job-openings	Two role cards → full role details → "Apply" button that emails info@kinzokutrade.com with the right subject	Current page
Privacy Policy	/privacy-policy	Same text, word for word, in a readable column with section links	Current page, unchanged
Blog index (new)	/blog	All articles as cards with title, date and summary, grouped by CBAM, Sourcing, Products	The 9 current articles
Blog articles (9)	Current addresses, for example /cbam-2026-complete-guide-steel-importers	Title, date, reading time → article → related articles → quote banner	Current embedded articles

Page	Address	New layout, top to bottom	Content taken from
Language pages (8)	Current addresses, for example /rollnaegel- palettenaegel- lieferant- palettenaegel	Same layout as Home, with the menu, buttons and footer translated and the correct page language set	Current embedded language pages
Not found and error pages	Any wrong address	Branded page with the menu, a search box and links to Home, Products and Contact	New

Shared on every page

- Header: logo, About Us, Products, CBAM, Blog, Contact, language switcher, "Request a quote" button.
- Footer: company name and address, email (clickable), phone, KvK, VAT, LinkedIn, Privacy Policy, Cookie settings, Job Openings, "© 2026 Kinzoku Consultancy & Trade".
- WhatsApp button that does not cover content, with the message "Hello Kinzoku, I would like a quote for ...".

Design system

The new look keeps Kinzoku's black and gold brand but uses it sparingly: mostly white pages, dark header and footer, gold only for buttons and highlights. That is what makes it read as formal.

Element	Choice
Main colours	Charcoal #14171A (header, footer), white #FFFFFF (page), gold #F2B705 (buttons, highlights only)
Text colours	Dark grey #1F2328 for body text, mid grey #5A6270 for secondary text
Supporting colours	Light grey #F4F5F7 for alternate sections, steel blue #2F4A63 for tables and links

Element	Choice
Headings font	Montserrat, weights 600 and 700 (already used by the site)
Body font	Open Sans, weight 400 (already used by the site), 16 px minimum
Fonts loading	Stored on Kinzoku's own server, not loaded from Google
Page width	Content no wider than 1200 px, with 24 px side margins on phones
Text alignment	Left-aligned everywhere; no stretched (justified) paragraphs
Corners and shadows	Small rounded corners (8 px), very light shadows only on cards
Photos	Kinzoku's own product, warehouse and shipment photos; no stock photos
Logo	Redrawn as a sharp vector file (SVG)
Motion	Short fade-in when sections appear; no bouncing or sliding effects

Reusable building blocks

Button (primary gold, secondary outline) · Header with drop-down menus · Mobile menu · Footer · Product card · Specification table that scrolls sideways on phones · Tabs · FAQ open/close list · Trust badge · Process stepper · Quote form · Quote banner · Cookie banner and settings panel · Blog card · Breadcrumbs · Language switcher · WhatsApp button.

Every block is built once and reused on every page, so all pages look alike, including the language pages.

How the site is built

To keep things simple, the website, the live channel and the database all run on one Hostinger server in the EU. There is no separate content system, no separate WebSocket host and no outside chat or form service.

Everything runs in one program on one EU server

how the site is built · one server, one program, one database

Visitors only load finished pages over HTTPS. Buyers and the sales team also open a secure live connection (WSS) for status and chat. Everything a user sends is stored in PostgreSQL on the same server.

Tools used

Part	Tool	Why
Website framework	Next.js 15 (App Router) with TypeScript	Builds pages in advance for speed; handles forms and the admin area in the same project
Styling	Tailwind CSS	Keeps the design system consistent on every page
Live updates	Socket.IO	WebSockets with automatic reconnect and a backup method for blocked networks

Part	Tool	Why
Database	PostgreSQL 16 with Prisma	Reliable, free, runs on the same server
Staff login	Auth.js	Secure login for the admin area
Emails	Nodemailer, sending from info@kinzokutrade.com	No new email company needed
Form checks	Zod	Same checks in the browser and on the server
Hosting	Hostinger VPS (EU), Docker, Caddy for HTTPS	Matches the Privacy Policy; automatic security certificates
Releases	GitHub Actions	One click sends tested code to staging, then to the live site

```

Database

One PostgreSQL database on the same Hostinger server stores the business data: quote requests, their files, chat messages and staff accounts. Page content (product text, blog articles, translations) stays in the code as simple text files, so there is no separate content system to run.

Table	What it stores	Main fields
<code>staff_users</code>	Kinzoku team members who log in to the admin area	name, email, password (encrypted), role (admin or sales)
<code>companies</code>	Buyers who became clients	company name, country, VAT number, client since
<code>rfqs</code>	Every quote request from the website	reference (for example KZ-2026-0001), company, contact name, email, phone, delivery country, product, specification, quantity, delivery terms, message, status, private status link, created date, linked company (if a client)
<code>rfq_files</code>	Drawings or specifications attached to a request	request, file name, size, storage location on the server
<code>rfq_status_history</code>	Every status change, for the record	request, old status, new status, changed by, date
<code>chat_messages</code>	Messages between a buyer and the sales team about a request	request, sender (buyer or staff), text, sent date, read date
<code>cbam_estimates</code>	Calculator results a visitor asked to receive by email	email, product type, tonnes, carbon price used, estimated cost, date

Quote status steps: Received → In review → Quote sent → Closed.

How buyers check their request without an account: after submitting, the buyer gets an email with a private link (for example `/rfq/status/...`). The link shows the live status and a chat with the sales team. No password, no sign-up.

Keeping to the Privacy Policy

- Every night, requests older than 12 months that are not linked to a client are deleted, together with their files and messages.
- Records linked to a client are kept for 7 years, then deleted.
- The database is only reachable from inside the server, never from the internet.
- A full backup is taken every night and kept for 14 days on Hostinger's storage.

Tools: PostgreSQL 16, Prisma (the code library that talks to the database and manages table changes safely).

WebSockets: what updates live

WebSockets are used only where someone is waiting for a reply: the sales team waiting for new requests, and a buyer waiting for news on their request. The public product and blog pages stay plain and fast, with no live connection.

Live feature	Who sees it	What happens
New request alert	Sales team, in the admin area	A new quote request appears instantly with a sound, without refreshing
Request status	Buyer, on their private status page	When sales moves the request to "In review" or "Quote sent", the buyer's page updates at once
Chat about a request	Buyer and sales team	Messages appear instantly both ways, with a "typing..." indicator and read marks
Sales team online	Visitors on the Contact page	Shows "Sales team online" when a team member is logged in, otherwise the usual reply time

How it works, simply

1. The WebSocket server (Socket.IO) runs inside the same program as the website, on the same server. There is nothing extra to host.
2. Every message or status change is saved in the database first, then sent live. If a connection drops, nothing is lost.

3. When a buyer reconnects, the page reloads any messages it missed from the database.
4. Buyers can only join the conversation for their own request, using the secret in their private link. Staff must be logged in.
5. All live traffic is encrypted (WSS), as the Privacy Policy requires HTTPS.
6. If a company network blocks WebSockets, Socket.IO automatically switches to a slower backup method, so the feature still works.

How each current issue gets fixed

Every problem listed in [Issues and Reconstructions](#) has a matching fix in the rebuild.

Current issue	Fix in the new site
Quote buttons on the 8 language pages lead to "Page not found"	<code>/contactus-sales</code> redirects to the quote form; all buttons point to real pages; an automatic link check runs before each release
No quote button on the English homepage	"Request a quote" in the headline, in the header on every page, and at the end of every page
"Reject all" cookies does not stop tracking	Google Analytics loads only after "Accept"; "Cookie settings" link in the footer to change the choice
Google tracking code added twice	Added once, in one place in the code
Google cannot read blogs, language pages, tables and FAQ	All content is part of the page itself; no embedded frames
Quote form is a Google Form	Kinzoku's own form, saved in Kinzoku's database, with file upload and a confirmation email
One generic form with bar-steel examples	The form changes its fields based on the product chosen (nails, wire or bars)
Language pages say they are English and use the English menu	Each language page sets its own language and shows a translated menu and footer

Current issue	Fix in the new site
No real About page	New <code>/about-us</code> page
Stock hero photo, blurry logo	Kinzoku's own photos; logo redrawn as a sharp vector file
Picture shown twice, cut off on phones	One process stepper that fits every screen
Tables spill off the screen	Tables scroll sideways inside their box on phones, with the first column fixed
Text touching the screen edge; stretched paragraphs	Fixed side margins on every page; left-aligned text
Different fonts and styles between pages	One design system used by every page
Footer labels split from values; email not clickable	Label and value on the same line; clickable email and phone
"© 2026-2030" and "BANK: ING" in the footer	"© 2026 Kinzoku Consultancy & Trade"; bank name removed from public pages
Phone number written three ways, one wrong	One phone number stored in one place and used everywhere, including Google's data
WhatsApp button covers content	Smaller button placed clear of links and hidden while a form is open
Plain "Website Builder 404" page	Branded "Page not found" page with menu, search and links
CBAM calculator uses a pop-up error and a fixed price	Error shown next to the field; price field editable; results can be emailed
No blog index, no dates or authors	New <code>/blog</code> page; each article shows date, reading time and related articles
Spelling and grammar mistakes	Corrected during content copy (list in the issues document)
Slow first load (about 7 seconds in testing)	Pages built in advance and served ready-made; images resized automatically; target under 2.5 seconds

Preventing loading errors and failures

Most pages are built in advance and served as finished files, so there is very little that can fail when a visitor opens them. The measures below cover the rest.

Fast loading

- Product, CBAM, blog, language and policy pages are built ahead of time and served ready-made.
- Images are resized and compressed automatically for each screen size, and load only when scrolled into view.
- Fonts are stored on Kinzoku's server, so no waiting on Google.
- No embedded frames, no Google Form, no Google Maps frame (a static map image that links to Google Maps instead).
- Tracking scripts load only after consent and never block the page.
- Targets checked before each release: page fully shown in under 2.5 seconds on a phone, Google Lighthouse score of 90 or higher.

No broken pages or links

- Automatic check of every internal link and button before each release.
- Every current web address is tested to make sure it still opens the right page.
- Branded "Page not found" and "Something went wrong" pages instead of blank errors.
- If one section of a page fails, only that section shows a short message; the rest of the page still works.

Forms and live features

- The quote form checks every field in the browser and again on the server, with clear messages beside each field.
- The form keeps what was typed if sending fails, and offers "Try again".
- Limits on how often one visitor can send the form, plus a hidden spam trap, to block robots without annoying people with puzzles.
- Uploaded files are limited to PDF, images and common office files, up to 10 MB each.
- Live chat and status reconnect by themselves after a network drop and reload anything missed.

Server and monitoring

- The site runs in a container that restarts itself if it crashes.
- Nightly database backup, kept 14 days; a restore is tested once before launch.

- A free uptime check emails the team if the site is down for more than 2 minutes.
- Server error logs are kept on the server for 30 days.
- Updates are tested on a separate copy of the site (staging) before going live, and the previous version can be restored in one step.

Execution plan

Five phases, each ending with a checkpoint Kinzoku approves before the next one starts. The old site stays live until launch day.

Phase 1 — Preparation (week 1)

1. Choose the optional features from the list at the end of this document.
2. Copy all current content: every page's text, tables, FAQ, CBAM calculator values, blog articles, language pages, job posts, and the Privacy Policy word for word.
3. Collect Kinzoku's own photos (products, coils, warehouse, containers) and the logo as a vector file.
4. Make a list of every current web address, to keep all of them.
5. Get access to the domain settings, Hostinger account and the info@kinzokutrade.com mailbox.
6. Order a Hostinger VPS in an EU data centre.

Checkpoint: content, photos and feature choices approved.

Phase 2 — Foundation (weeks 2-3)

1. Create the Next.js project (TypeScript, App Router) in a private code repository.
2. Build the design system: colours, fonts, spacing and all reusable blocks.
3. Build the shared header, mobile menu, footer, language switcher and WhatsApp button.
4. Build the cookie banner and settings panel so tracking waits for consent.
5. Build the "Page not found" and "Something went wrong" pages.
6. Set up the server: Docker, PostgreSQL, HTTPS certificate, and a staging copy at a private address.
7. Set up one-click releases from the code repository to staging and to the live site.

Checkpoint: design and page shell approved on staging.

Phase 3 — Pages and content (weeks 4-6)

1. Build Home and the new About Us page.
2. Build the three product pages with readable tables, tabs and FAQ.
3. Build the CBAM page and rebuild the calculator as part of the page.
4. Build Job Openings and the Privacy Policy page (text unchanged).
5. Move the 9 blog articles into the site and build the blog index.
6. Build the 8 language pages with translated menu and footer.
7. Correct the spelling and grammar mistakes while copying content.
8. Add page titles, descriptions, sharing images, the site map for Google and the redirect for `/contactus-sales`.

Checkpoint: all pages reviewed and approved on staging.

Phase 4 — Database and live features (weeks 7-8)

1. Create the database tables and the nightly clean-up and backup jobs.
2. Build the quote form: product-based fields, file upload, saving to the database.
3. Send emails from `info@kinzokutrade.com`: confirmation with private status link to the buyer, alert to the sales team.
4. Build the staff login and the admin area: list of requests, request details, status buttons.
5. Add the WebSocket server and connect the live features: new-request alerts, live status, chat, "Sales team online".
6. Add "Send me this estimate" to the CBAM calculator.
7. Add any optional features chosen in Phase 1.

Checkpoint: a test request goes through every step, from form to quote sent, with chat.

Phase 5 — Testing and launch (weeks 9-10)

1. Test on phones, tablets and computers (Chrome, Safari, Edge, Firefox).
2. Test keyboard use and screen-reader basics on every page type.
3. Run the speed checks and the broken-link check; fix anything below target.
4. Confirm every old web address opens the right new page.
5. Confirm cookies: nothing tracks before "Accept".
6. Test a database backup restore.
7. Train the sales team on the admin area and chat (about 1 hour).
8. Switch the domain to the new server at a quiet time; keep the old site available for rollback for 2 weeks.

9. Submit the site map to Google Search Console and watch for errors for 2 weeks.

Checkpoint: site live, old site retired after 2 weeks without issues.

After launch

- Monthly: software updates, backup check, speed check.
- Every 3 months: review Google Search Console and quote-form numbers.

Timeline

Five phases, each closed by a Kinzoku approval

About 10 weeks for one developer (estimate); bands not drawn to scale

rebuild roadmap · 5 phases, 5 checkpoints

Optional features chosen below add to Phase 4 and push launch back by their extra time.

Feature options

Everything above is the core rebuild. The features below are optional: pick Include, Later or Skip in the last column, and the chosen ones are added in Phase 4. Extra time is an estimate for one developer.

Feature	What it does	Area	Extra time	Privacy Policy change needed	Your choice
Nail specification builder	Buyer picks angle, shank, finish, size and coil count; gets a spec sheet attached to the quote request	Sales	1 week	No	▼

Feature	What it does	Area	Extra time	Privacy Policy change needed	Your choice
Machine compatibility finder	Buyer selects their nail gun or pallet line and sees matching nails or wire	Sales	3 days	No	▼
Downloads area	Product sheets, sample EN 10204 3.1 certificate, EPAL and CBAM declarant proof as PDFs	Sales	2 days	No	▼
Sample request	Buyer asks for a small trial quantity instead of a full quote	Sales	2 days	No	▼
Quote as PDF	Sales creates a branded PDF quote from the admin area and sends it in the chat	Sales	3 days	No	▼
Case studies	Customer stories with country, tonnage and machine type	Content	3 days (plus Kinzoku's content)	No	▼
Buyer accounts	Buyers log in to see all their requests, orders and documents in one place	Live	2 weeks	No	▼
Live order and shipment tracking	Buyers see production, shipping, vessel arrival and customs/CBAM clearance update live	Live	2 weeks (needs Buyer accounts)	No	▼
Live EU carbon price	CBAM calculator uses the current carbon certificate price instead of a typed number	Live	3 days (needs a price data source)	No	▼
Page and blog editor	Kinzoku staff edit pages and publish blog posts without a developer	Content	1 week	No	▼
Site search	Search box for products, articles and FAQ	Content	2 days	No	▼
Newsletter sign-up	Visitors opt in to CBAM and market updates, sent from Kinzoku's mailbox	Content	3 days	No (already covered under Consent)	▼

Feature	What it does	Area	Extra time	Privacy Policy change needed	Your choice
Sales numbers dashboard	Requests per month, by product and by country, in the admin area	Admin	1 week	No	▼
Two-step login for staff	A code from a phone app is needed to log in to the admin area	Admin	1 day	No	▼
Job application form	Candidates apply on the site with CV upload instead of by email	Content	3 days	Yes: job applicant data is not mentioned today	▼
Error tracking service	An outside service (for example Sentry) reports website errors to the developer	Admin	1 day	Yes: a new outside service	▼
WhatsApp in the admin chat	WhatsApp messages from buyers appear in the same admin chat as website messages	Live	1 week	Yes: WhatsApp (Meta) as a new service	▼
